

Inbound Cause Analysis

A root-cause analysis pipeline for inbound GTM — flipped from **what to fix** to **what to amplify**.

GTM teams optimize tactics — channel mix, copy tests, routing rules — and still cannot answer the question in the middle: **which messages, channels, and journeys actually produced revenue**. ICA reconstructs why inbound converts from 2,500 leads of synthetic CRM data, then auto-drafts the GTM plays to do more of it.

WHAT IT FOUND — FIVE PATTERNS IN WHY INBOUND CONVERTS

F1	Channel-quality surprise. Podcast leads close at 30% ; LinkedIn-paid leads at 3% — a quality gap that runs directly against volume.	10x
F2	Message-persona resonance. A manual-work-reduction message closes mid-market RevOps leaders at 25% vs 2.9% for every other persona.	8.7x
F3	The winning journey. A podcast → organic-search → demo path within 14 days closes at 44% against a 7.1% baseline.	6.2x
F4	ICP fit vs volume. The largest LinkedIn campaign carries an 80% bad-outcome share — mean ICP-fit score 37 against a dataset-wide 53.	80%
F5	Compliance resonance. Enterprise IT buyers close at 18% on a compliance/security message — a lift over every other persona.	5.0x

Synthetic data → 5 SQL findings → Claude resonance extraction → Claude artifact generation → Streamlit dashboard. The LLM layer reads all 2,736 raw buyer-text snippets and re-derives the themes independently — **94.1%** agreement with ground truth, **99.1%** stable across three runs.

WHAT IT SHIPPED — FIVE GTM ACTION ARTIFACTS, ONE PER FINDING

- **Content brief** — a podcast-anchored “Manual Ops Tax” campaign that replicates the channel that converts.
- **Ad-copy variants** — four paid variants for the mid-market RevOps persona, written in the buyers’ own language.
- **Sequence play** — a six-touch, 14-day sequence that systematizes the winning multi-touch journey.
- **ICP refinement** — exclusion and inclusion criteria to stop the broad-funnel campaign’s wasted spend.
- **Ad-copy variants** — four compliance-angle variants for the enterprise IT persona.

WHY IT MATTERS

Most analytics stops at a dashboard: here is what happened, good luck. ICA closes the loop — **every finding ends in a GTM artifact a team can ship this week**, emitted as Markdown to read and JSON to route into Marketo, HubSpot, or Salesforce. It runs on a deterministic synthetic dataset and is one ingestion swap away from real CRM data. That loop — analysis that ends in shipped action, not another dashboard — is what a GTM Engineer who can build delivers.
